

# Orbit Digital — Synthetic RFP Response

Fictional classroom proposal for Agentic RFP Evaluation

## 1. Executive Summary & Understanding

Orbit Digital has strong experience and references and offers medium pricing. Its main weakness is a relatively vague integration approach and limited detail on interface ownership.

The supplier understands the requirement as a procurement platform needing a scalable solution, predictable delivery, transparent commercial assumptions, strong controls, and reliable post-go-live support.

## **2. Proposed Solution & Implementation Approach**

Orbit proposes a cloud-hosted platform with reusable services and an integration hub. It describes the target user journey and major technology choices but gives only high-level detail about API contracts, error handling, and integration sequencing.

The proposal targets 18 weeks with discovery, configuration, development, testing, and launch phases. Staffing includes an engagement lead, architect, four engineers, QA, and a shared security specialist. Milestones are described at a high level.

Key delivery assumptions include access to business stakeholders, timely decisions, and controlled change management. The supplier will provide documentation and knowledge transfer at project milestones.

### 3. Commercial Proposal

| Item                | Proposal                                                                                                                                                       |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation      | Implementation fee: \$390,000.                                                                                                                                 |
| Annual support      | Annual support: \$60,000.                                                                                                                                      |
| Cloud / assumptions | Cloud consumption is estimated at \$8,000-\$11,000 monthly. Pricing is transparent and includes a change-control assumption for work outside the stated scope. |

Implementation fee: \$390,000. Annual support: \$60,000. Cloud consumption is estimated at \$8,000-\$11,000 monthly. Pricing is transparent and includes a change-control assumption for work outside the stated scope.

## **4. Security, Compliance & Risk Controls**

Orbit describes encryption, identity federation, least privilege, audit trails, backup, vulnerability scanning, and incident management. It references prior regulated-industry work but gives less detail than Apex on the specific control implementation.

Primary risks and mitigations: integration dependencies are managed through early interface workshops; delivery risk is reduced through milestone acceptance; operational risk is reduced through monitoring, backups, and incident procedures.

## **5. Support, Experience & References**

Orbit offers 24x7 critical support, a named account lead, quarterly reviews, training, and five relevant references. It reports 12 years of relevant experience and emphasizes successful work with complex enterprise customers.

References in this fictional document are illustrative only and do not identify real customers.
